Abstract

This paper aims to highlight the beneficial therapeutic effects of the administration of herbal extracts in patients with psoriasis, correlated with the variation of blood biochemical markers in clinical context (Roşoiu N., Verman I.G., 2008). At the same time, by analysing these parameters, we proposed to refer to the therapeutic contraindications, the diet regime and the evolution of the biological constants during and after the action of the administered therapeutic products, in correlation with the possible diseases associated with the treated disease.

Keywords: psoriasis, treatment of psoriasis, natural treatment.
