

„TRAUMATOLOGIE OSTEOARTICULARĂ GENERALĂ”

Author: NICOLAE GORUN

“Curtea Veche” Publishing House, Bucharest, 2011

The recent editorial publishing bearing the signature of the well-known orthopaedist and traumatologist Professor Nicolae Gorun is an exceptional monography.

The book is extended over more than 612 pages and it is written in a highly academically style.

The exceptional bibliography is worth mentioning, as well as the iconography and the numerous and very suggestive color photos.

Basically the book can be divided into three major parts.

The first part entitled „Moments in the history of osteo-articular traumatology”, which presents original data from the historical evolution of traumatology and it is the most valuable history for the Romanian traumatology

ever occurred here.

The second chapter is entitled „General overview of trauma”.

In this chapter, the modern data etiopathogenesis, physiopathology, pathology, diagnosis and treatment principles are being presented, very useful to someone who wants to acquire traumatology.

The third chapter, the widest, refers to the „Morbidity through musculoskeletal trauma. Personal statistical study”.

Here is the quintessential work, the author’s experience with all types of trauma, presented honestly, in a critical, but constructive way.

For me, personally, this chapter is a premiere as I haven’t met it at any other authors.

The monography concludes with a chapter entitled „incidences and complications of metallic osteosynthesis” a very important chapter for trauma practice.

This achievement of Professor Nicolae Gorun is very useful to the specialist in musculoskeletal traumatology, it is an extremely valuable material for research and for those who are initiated in this specialty, this book should not miss from their bookshelves.
