Abstract: *The work presents a study regarding the recycling of polyamide 6 products processed by extrusion/injection molding to be used as matrix in laminated composites reinforced with carbon fiber fabric (as-received and surface oxidized in laboratory). The results highlight the similarity between the recycled PA6 based carbon fiber composites and the reference samples based on pure PA6 and the two carbon fiber variants, in terms of mechanical performance at tensile and flexural loads, physical-chemical and morphological characteristics as well as fracture behavior. This confirms that PA6 waste products can be harnessed into products with high performance for different applications.*

Keywords: thermoplastic polymer, plastic materials recycling, carbon fiber composites, waste recovery.
