**Rezumat:** Scopul acestui articol este studiul influenței componentelor unui material compozit multistrat cu miez de tip fagure asupra modului de preluare a unei sarcini statice complexe, în domeniul liniar elastic. Pentru efectuarea acestui studiu s-a folosit simularea numerică, iar rezultatele obținute au fost validate pe cale experimentală.

**Abstract:** The purpose of this article is the evaluation of the influence of the components of a multilayered honeycomb composite material, as to the load carrying capacity, when the material is subjected to a complex static loading, in the linear elastic domain. The numerical simulation approach was used for this study, and the results were validated experimentally.

**Keywords:** multilayered honeycomb structure components, numerical simulation, experimental validation.
