# VASCULAR THROMBOSIS IN CHILD CARE PRACTICE

Gheorghe Chiriac Babei, Cristina Stoica,  
Mariana Vasilescu, Alexandra Gluck, Adrian Lungu<sup>1</sup>

*Pediatric Clinic of Fundeni Clinical Institute, Bucharest*

### Abstract

*Although relatively frequent in adult care practice, thrombotic stroke is quite rare in child care practice. The authors analyze the diagnosis and treatment difficulties of vascular thrombosis in children, in terms of their own clinical practice.*

**Keywords:** *Pediatric venous Thrombosis, Nephrotic syndrome, Lupus, Treatment*

### Rezumat

*Accidental vascular trombotic, relativ frecvent în patologia adultului, este relativ rar în practica pediatrică. Autorii analizează prin prisma cazuisticii proprii problemele de diagnostic și tratament în trombozele vasculare la copil.*

**Cuvinte-cheie:** *Tromboza venoasă la copil, Sindrom Nefrotic, Lupus, Tratament*

### General considerations

Vascular thrombosis represent a rare failures in medical practice of the child.

The polymorphism in the etiology, the relative rarity and semiologic complexity make the performance of homogeneous trials difficult, so that the discussion and diagnosis and therapeutic standardization are still in the phase of desideratum. Its high severity, "life threatening", determines the agglomeration of these cases in special intensive care units, so that the approach becomes particular to them.

A point of view from the patient's age, vascular thromboses of the child are divided in two groups:

- A. *Neonatal vascular thromboses*
- B. *Infant and child vascular thromboses*
